

# Machine Intelligence:: Deep Learning

*Beate Sick, Lilach Goren, Pascal Bühler*

Institut für Datenanalyse und Prozessdesign  
Zürcher Hochschule für Angewandte Wissenschaften

# Outline of the DL Module (tentative)

The course is split in 8 sessions, each 4 lectures long. Topics might be adapted during the course

Day	Date	Time	Topic
1	15.04.2025	09:00-12:30	Introduction to Deep Learning & Keras, first NNs
-	21.04.2025	-	FRÜHLINGS-FERIEN
-	28.04.2025	-	FRÜHLINGS-FERIEN
2	06.05.2025	09:00-12:30	Loss, Optimization, Regression, Classification
3	13.05.2025	09:00-12:30	Computer vision, CNN-architecture
4	20.05.2025	09:00-12:30	DL in practice, pretrained (foundation) models
5	27.05.2025	09:00-12:30	Model evaluation, baselines, xAI, troubleshooting
6	03.06.2025	09:00-12:30	Generative Models, Transformer-architecture
7	10.06.2025	09:00-12:30	Vision Transformer
8	17.06.2025	09:00-12:30	Projects, deep Ensembling

# Look back on homework: MNIST with CNN

Use a CNN to classify MNIST data to 10 possible classes

[06\\_cnn\\_mnist\\_shuffled\\_keras\\_torch.ipynb](#) <- first part with the unshuffled cnn

FCNN	Accuracy = 0.9255
CNN	Accuracy = 0.9861

What is a good  
CNN architecture?

# CNN breakthrough in 2012: Imagenet challenge

1000 classes  
1 Mio samples

Human: 5% misclassification

Only one non-CNN  
approach in 2013

GoogLeNet 6.7%

A. Krizhevsky  
first CNN in 2012

**Und es hat zoom gemacht**

# Review of ImageNet winning CNN architectures

# The trend in modern CNN architectures goes to small filters

Why do modern architectures use very small filters?

Determine the receptive field in the following situation:

1) Suppose we have **one**  
**7x7 conv layers** (stride 1)  
**49 weights**

2) Suppose we **stack two**  
**3x3 conv layers** (stride 1)

3) Suppose we **stack three**  
**3x3 conv layers** (stride 1)  
**3\*9=27 weights**

**We need less weights for the same receptive field when stacking small filters!**

# “Oxford Net” or “VGG Net” 2014 2<sup>nd</sup> place

- 2<sup>nd</sup> place in the imageNet challenge
- More **traditional**, easier to train
- Small pooling
- **Stacked 3x3 convolutions before maxpooling**  
-> **large receptive field**
- no strides (stride 1)
- ReLU after conv. and FC (batchnorm was not introduced)
- Pre-trained model is available (see exercise)

<http://arxiv.org/abs/1409.1556>

## "ResNet" from Microsoft 2015 winner of imageNet

152  
layers

## ResNet basic design (VGG-style)

- add shortcut connections every two
- all 3x3 conv (almost)

$$H(x_i) = x_{i+1} = x_i + F(x_i)$$

$F(x)$  is called “residual” since it only learns the “delta” which is needed to add to  $x$  to get  $H(x)$

152 layers:  
Why does this train at all?

This deep architecture could still be trained, since the gradients can skip layers which diminish the gradient!

## Tricks of the trade

- Early stopping
- Input Standardization
- Batch Norm Layer
- Dropout
- Data augmentation

# Best practice: Split in Train, Validation, and Test Set

Best practice: Lock an extra **test data set** away, and use it only at the very end, to evaluate the chosen model, that performed best on your validation set.

Reason: **When trying many models, you probably overfit on the validation set.**

Determine performance metrics, such as MSE, to evaluate the predictions **on new validation or test data**

# Loss curve and early stopping

Very common check: Plot loss in train and validation data vs epoch of training.

Training completed all epochs.  
Best model weights were restored from epoch 11

```
## Early Stopping
early_stopping = EarlyStopping(
    monitor='val_loss',
    patience=10,
    verbose=1,
    restore_best_weights=False
)
```

- If **training loss** does not go down to zero: model is not flexible enough
- Use weights @minimum of validation before overfitting
- Early stopping: stop to training if validation loss does not improve anymore

[07\\_early\\_stopping\\_and\\_modelweights](#)

# Take-home messages from CIFAR10 CNN study

- DL does not need a lot of preprocessing, but working with standardized (small-valued) input data often helps.

Without normalizing  
the input to the CNN

With normalizing  
(pixel-value/255)  
the input to the CNN

## Regularization to avoid overfitting

- Batchnorm layer
- Dropout layer

# What is the idea of Batch-Normalization (BN)

# Dropout helps to fight overfitting

Using **dropout** during training implies:

- In each training step only weights to not-dropped units are updated  $\rightarrow$  we train a sparse sub-model NN
- For predictions with the trained NN we freeze the weights corresponding to averaging over the ensemble of trained models we should be able to “reduce noise”, “overfitting”
- JFI: To get same expected output in training (with dropout) and after training (test time - without dropout), the weights are multiplied after training by the dropout probability  $p=0.5$ .

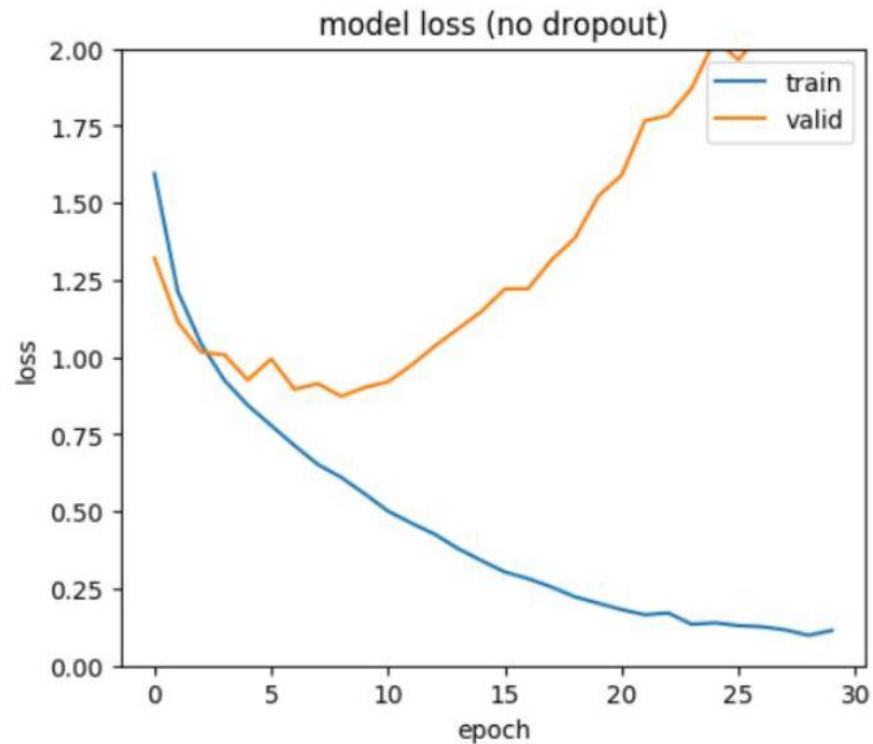

# Dropout

Three NNs:

a) shows the full NN with all neurons (as used when NN is trained),  
b) and c) show two versions of a thinned NN where some neurons are dropped (as done during training with dropout). Dropping neurons is the same as setting all connections that start from these neurons to zero.

# Dropout fights overfitting in a CIFAR10 CNN

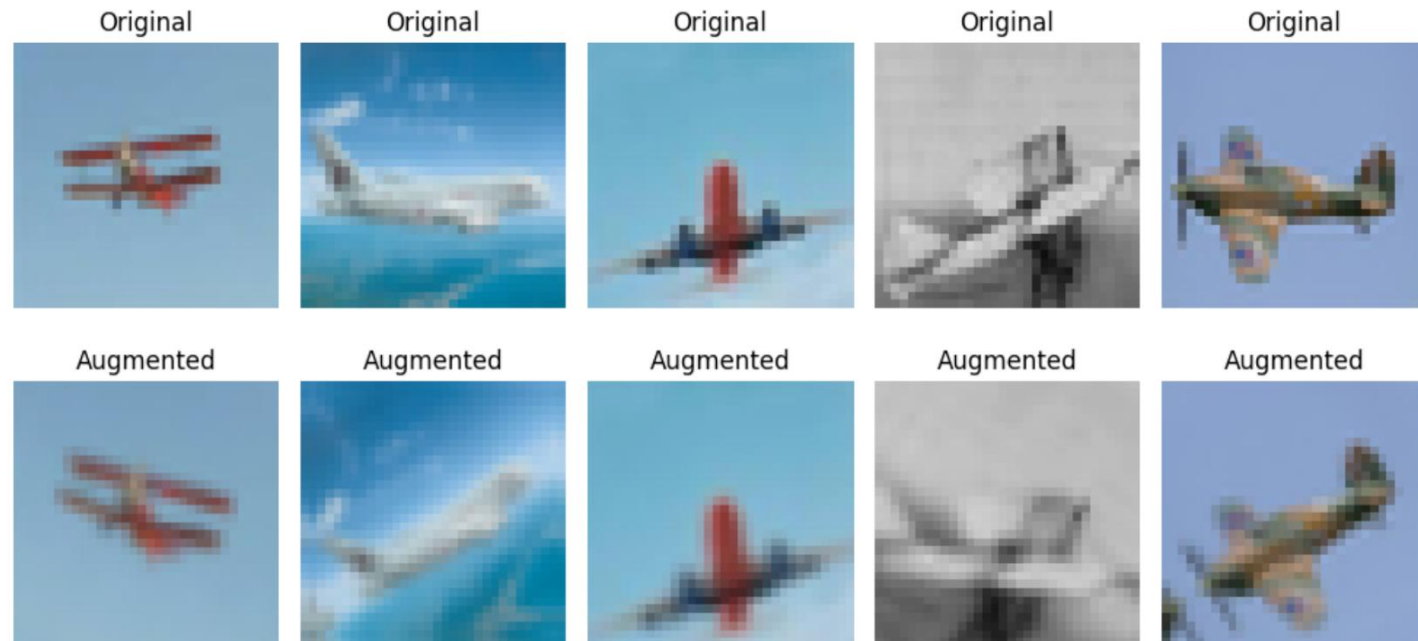

# What to do in case of limited data?

- Data augmentation
- Pretrained (foundation) models

# Fighting overfitting by Data augmentation:

During training random operations are done on the fly

- Rotate image within an angle range
- Flip image: left/right, up, down
- resize
- Take patches from images
- ....

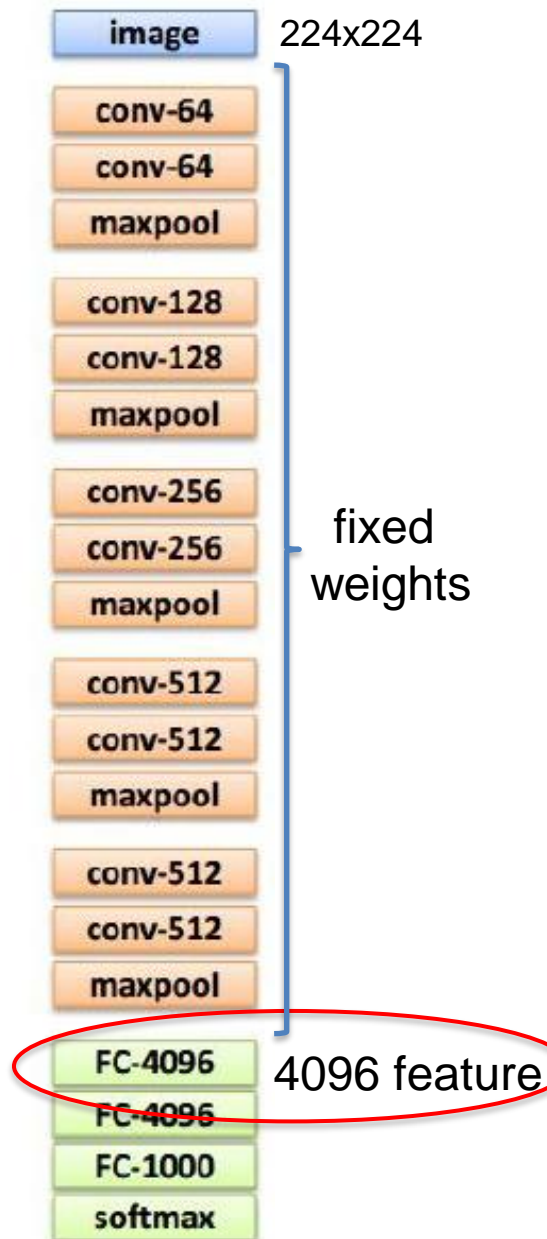

# In Code: Augmentation

```
1 # Define data augmentation pipeline
2 from keras.layers import RandomFlip, RandomRotation, RandomContrast, RandomZoom
3 data_augmentation = keras.Sequential([
4     #RandomFlip("horizontal"),      # Randomly flip images horizontally
5     RandomRotation(0.1),            # Randomly rotate images by 10%
6     RandomZoom(0.1),               # Randomly zoom in on images
7     #RandomContrast(0.1),          # Adjust contrast randomly
8 ], name='Augmentation')
9
```

```
1 # Functional API Model Definition
2 x = Input(shape=input_shape)
3 x = data_augmentation(x)
4 # First Convolutional Block
5 x = Convolution2D(8, kernel_size, padding='same')(x)
6 ...
```

[07\\_cifar10\\_tricks\\_keras\\_torch.ipynb](#)

# Use pre-trained CNNs for feature generation

- Load a pre-trained CNN – e.g.g VGG16  
developed by Karen Simonyan and Andrew Zisserman in 2014
- Images are resized to required size
- Rescaling of the pixel values to “VGG range”
- Do a forward pass and **fetch features** that are used as CNN representations, dump these features into a file on disk
- Use these CNN features as input to a simple classifier – e.g. fc NN, RF, SVM ...  
(here it is easily possible to adapt to the new number of class labels)

Number features depends on input shape

Fetch this CNN feature vector for each image

# Transfer learning beyond using off-shelf CNN feature

e.g. medium data set (<1M images)

## finetuning

more data = retrain more of the network (or all of it)

Freeze these (learning rate =0)

tip: use only ~1/10th of the original learning rate in finetuning top layer, and ~1/100th on intermediate layers

Train this

The strategy for fine-tuning depends on the size of the data set and the type of images:

	Similar task (to imageNet challenge)	Very different task (to imageNet challenge)
little data	Extract CNN representation of one top fc layer and use these features to train an external classifier	You are in trouble - try to extract CNN representations from different stages and use them as input to new classifier
lots of data	Fine-tune a few layers including few convolutional layers	Fine-tune a large number of layers

Where to get pretrained CNNs like VGG16 or ResNet: <https://keras.io/api/applications/>

Hint: first retrain only fully connected layer, only then add convolutional layers for fine-tuning.

# Performance of off-the-shelf CNN features when compared to tailored hand-crafted features

CNN's distributed and compositional features generalize well to new tasks

“Astonishingly, we report consistent superior results compared to the highly tuned state-of-the-art systems in all the visual classification tasks on various datasets.”

# Use features from a pretrained VGG as input to t-SNE

- Different tissue types cluster together in t-SNE: we could use knn as classifier
- VGG features even work on images that are far away from the 1000 imageNet classes

# Case Study: CIFAR10 Dataset

# Cifar10 Data

10 Classes, with 5'000 images for training

Some examples:

VGG-19 with GradInit	2021	94.71
ResNet-18	2022	95.55

# Dataset Splitting in Machine Learning Competitions

- Training Set
  - The set you get for training, you can do what you want with it.
- Test Set:
  - Final evaluation set, never seen by the model during training (e.g., 10,000 images in CIFAR-10).

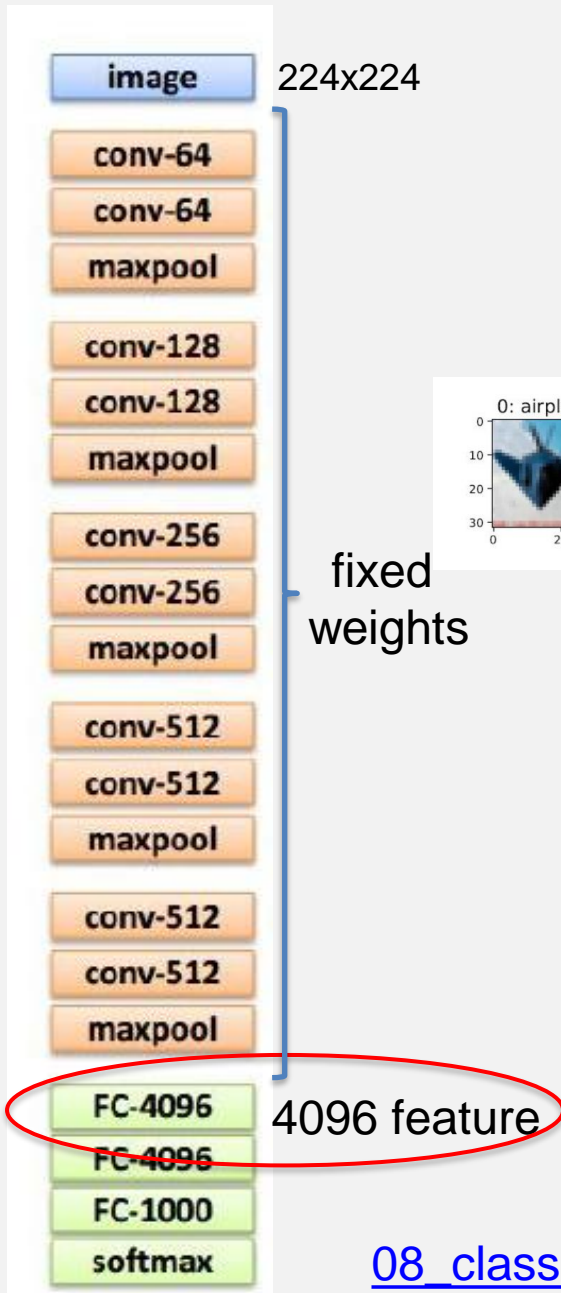

Note: CIFAR-10 and many other datasets do NOT provide a separate validation set.

- Typical Workflow
  - Hyperparameter Tuning
    - **Create validation set** from training set
      - Helps in tuning hyperparameters and preventing overfitting.
      - Common practice: split 80% training / 20% validation (e.g., 40,000 train / 10,000 validation).
  - Final Training: After hyperparameter tuning, models are often retrained on the entire training set
  - Evaluation on test set
    - Sometimes test set is secret and you to upload you predictions (private test set)

```
(x_train, y_train), (x_test, y_test) = cifar10.load_data()
```

# Exercise: Transfer learning with CIFAR10 data

rf on vgg features

transfer learning on vgg features

cnn from scratch with data augmentation

[08\\_classification\\_transfer\\_learning\\_few\\_labels\\_keras\\_torch.ipynb](#)

# Take home: DL with images in practice

- Use NN architectures inspired by challenge winning NNs
- Use tricks of the trade when building a CNN
  - Normalization of input data
  - Batchnorm
  - Dropout
  - Data Augmentation
  - Early stopping (patience)
- In case of few data
  - Do augmentation during training of a CNN
  - Use shallow learner (e.g. RF) based on image features extracted via pretrained CNNs
  - Fine-tune a pretrained CNN on few data (transfer learning)
- Use pretrained (foundation) models
